

Implementation Plan  
for the  
Storm Water Management Plan

1. Create list of culverts from the report in need of sediment removal and request either the private property owner or the public agency with jurisdiction to perform the required maintenance (KCRC, KCDC, MDOT, etc)
2. Coordinate with KCRC for replacement of culverts noted in report to be of possible inadequate size.
3. Identify stabilization measures required in County Drains and request maintenance by KCDC.
4. Identify possible flood control projects and encourage property owners to work with the KCDC for establishment of a County Drain.
5. Township to annually allocate approximately \$10,000 to provide for public education regarding storm water quality and stream bank stabilization measures.
6. Township to annually allocate approximately \$10,000 to provide analysis of specific problem areas and provide opportunities for public meetings.
7. Township to annually allocate approximately \$50,000 per year to perform work related to erosion control and stream bank stabilization. Money could also be used to help buy property to assist in storm water control i.e. regional detention pond. Specific projects may be identified by the Township or through submittal of a Petition submitted by an individual or group of property owners

Projects will be prioritized based on:

- a. Property owner contribution either through in-kind services or cash.
  - b. Severity of the degradation and the magnitude of the positive impact of the improvements on the drainage district
  - c. Accessibility for the required repair(s).
  - d. Availability of adequate funds
8. Encourage property owners within drainage districts requiring work to petition for a public project for the purposes of forming Special Assessment Districts under Public Act 116 of 1923. Approximately \$50,000 will be allocated
